

Stubbed OTP Login Flow (Playwright)

How the automated test logs in by faking the OTP & session responses — no real SMS required.

— Test drives the UI — Real call to backend — Intercepted & stubbed (page.route) - - - Response returned

Important — this is a frontend-only login. The real OTP 5401 is rejected by the backend (returns 400), and authentication is enforced server-side via a session cookie. The stubs make the app *believe* it is logged in, which is perfect for UI test flows. Actions the backend independently re-validates (placing orders, real account data) will still return 401. A fully real session requires a valid OTP.
